

This listing of the claims replaces any and all prior versions and listings of claims in the application:

LISTING OF THE CLAIMS

1 (Original): A method for making a magnetic recording disk comprising:

(a) forming an underlayer on a disk substrate;

(b) sputter-depositing a magnetic layer onto the underlayer;

(c) sputter-depositing a carbon overcoat onto the magnetic layer, said carbon overcoat having pinholes therein exposing the magnetic layer; and

(d) applying to the carbon overcoat a corrosion-protective composition containing a corrosion-protective agent comprised of a metal salt of a perfluorinated polyether having at least one carboxylic acid group, a metal salt of a partially hydrogenated perfluorinated polyether having at least one carboxylic acid group, or a mixture thereof, thereby filling any pinholes in the carbon overcoat with the corrosion-protective composition.

2 (Original): The method of claim 1, wherein the magnetic layer is comprised of a metal, a metal alloy, or a metal oxide.

3 (Original): The method of claim 2, wherein the magnetic layer is comprised of a metal alloy.

4 (Currently Amended): The method of claim 3, wherein the metal ~~allay~~alloy is a cobalt-based alloy.

5 (Original): The method of claim 4, wherein the corrosion-protective agent comprises a metal salt of a perfluorinated polyether having two carboxylic acid groups.

6 (Original): The method of claim 1, wherein the underlayer comprises a chromium-containing material.

7 (Original): The method of claim 1, further comprising coating the carbon overcoat with a lubricating film of a perfluoropolyether prior to deposition of the carbon overcoat.

8 (Original): The method of claim 1, wherein the perfluorinated polyether is comprised of monomer units having the structure $-\text{CF}_2-\text{O}-$, $-\text{CF}_2-\text{CF}_2-\text{O}-$, $-\text{CF}(\text{CF}_3)-\text{O}-$, $-\text{CF}(\text{CF}_3)-\text{CF}_2-\text{O}-$, or a combination thereof.

9 (Original): The method of claim 1, wherein the corrosion-protective agent comprises a partially hydrogenated perfluorinated polyether comprised of monomer units of the structure $-\text{CF}_2-\text{O}-$, $-\text{CF}_2-\text{CF}_2-\text{O}-$, $-\text{CF}(\text{CF}_3)-\text{O}-$, $-\text{CF}(\text{CF}_3)-\text{CF}_2-\text{O}-$, or a combination thereof before hydrogenation.

10 (Original): The method of claim 9, wherein based upon the corresponding perfluorinated polyether up to about 50% of the fluorine atoms are substituted with a hydrogen atom in the partially hydrogenated perfluorinated polyether.

11 (Original): The method of claim 1, wherein the perfluorinated polyether is a linear polymer.

12 (Original): The method of claim 1, wherein the metal salt is an alkali metal salt.

13 (Original): The method of claim 12, wherein the alkali metal salt is a sodium salt.

14 (Original): The method of claim 1, wherein the perfluorinated polyether has a number average molecular weight in the range of approximately 500 to 10,000.

15 (Original): The method of claim 14, wherein the perfluorinated polyether has a number average molecular weight in the range of approximately 1000 to 5000.

16 (Original): The method of claim 15, wherein the perfluorinated polyether has a number average molecular weight in the range of approximately 2500 to 3500.
